BUS708 Statistics and Data Analysis

Assessment 3 Report

Topic: housing purchase data, property features, loan prediction and temporary accommodation survey

1. Introduction

This report uses descriptive statistics, confidence intervals, hypothesis testing, regression analysis and chi square testing to provide answers to the practical business questions concerning Australian housing purchase decisions and preference for temporary accommodation. The intent is not to just provide statistics, but to understand how to interpret them and to provide them in such a way that they can be useful to the manager, property investors, agents and accommodation managers, and lenders. The structure of the report is as required in the BUS708 Assessment 3; Section 2 – 5 use Dataset 1 and Section 6 use Dataset 2.

The file called Dataset 1 is the edited housing purchase data set that has 2,500 observations for which all the data items are available. This has eight variables: property_type, furnishing_status, property_size_sqft, price, rooms, customer_salary, loan_amount and down_payment. The variables are categorical variables like property type and furnishing status or numerical variables like price, number of rooms and loan amount etc. The primary goals of Dataset 1 are to test if the Studio property proportion is comparable to that of a 20% benchmark, to test if Apartment property has a higher average price than the Unfurnished Independent House, to determine if there is a significant difference between the average prices of a Fully-Furnished Independent House and an Unfurnished Independent House, and to determine if the loan amount can be predicted based on the customer salary, down payment and property size.

The second dataset is a small survey that has 40 responses of the type: "temporary accommodation. It has two categorical variables, namely: Preferred accommodation type and Main booking priority. The research question of this data is if there is an association between the accommodation preference and the booking priority. This is significant for the accommodation industry as Airbnb, hotels and serviced accommodation are competing on the price, location, reviews and facilities. The data are categorical; thus a Chi-square test of independence is appropriate.

The literature reviewed backs up the variables selected and the relevance of the business analysis. The analysis of loan amount, salary and down payment is supported by the close relationship between Australian house prices and household debt, both with borrowing conditions and with how much people borrowed and how much their earnings were when they took out the loans, as well as with their expectations of future house prices, which drive the demand for housing, according to Day (2019). The use of statistical modelling in the context of the examination of the Airbnb listings and house prices in London demonstrates that quantitative methods can be used to analyse the data from the accommodation. The statistical modelling of the Airbnb listings and the house prices in London has been conducted by Todd, Musah and Cheshire (2022), which indicates that the data from the accommodation can be analysed using quantitative methods. Additionally, Dataset 2 is relevant to real market debates around Airbnb and temporary accommodation, as is demonstrated by Garay-Tamajón et al. (2022) who demonstrate that Airbnb is a phenomenon that can have an impact on housing affordability and destination neighbourhoods.

There are multiple restrictions. Note that Dataset 1 is an 'edited' dataset and the outcomes should be seen as a sample of the housing market in Australia and not a complete picture of the housing market. It also doesn't account for key factors like suburb, interest rate, age of property, price code, buyer credit score or economic conditions. The number of responses for dataset 2 is small (40) and there are just two categorical questions so it is appropriate for an association test but is not representative of all travellers. These restrictions should be taken into account when using this information to make decisions and while the results should be treated as a good indicator, it should not be the sole indicator of the market prior to large investments.

2. Do you believe that 20% is a plausible value for the proportion of Studio property type in Australian housing?

The first analysis looks at the distribution of types of properties within Dataset 1. The total number of properties sampled is 2,500. We have 398 observations in the Studio category, which is 15.9% or 0.159 of the sample. This is below the recommended level of 20%. The sample proportion cannot, however, answer the question. The sample proportion might not be the same as the actual population proportion, caused by sampling error, so a 95% confidence interval is required¹.

Table 1: Property type frequency and proportion

Property type	Count	Proportion
Apartment	418	0.167
Farmhouse	435	0.174

¹ https://papers.ssrn.com/sol3/papers.cfm?abstract_id=6506881

Property type	Count	Proportion
Independent House	439	0.176
Studio	398	0.159
Townhouse	402	0.161
Villa	408	0.163

Figure 1: Property type proportions in Dataset 1

The sample proportion for the property type is Studio is $\hat{p} = 0.159$. The standard error is 0.007 and the critical value for 95% is 1.960. Thus, the margin of error is 0.014. The 95% confidence interval is (0.145, 0.174). This interval indicates that, based on this sample, the proportion of Studio properties in the population lies somewhere between 14.5% and 17.4%.

The number 0.200 is outside the 95% confidence interval. Thus, a property proportion of 20% is not realistic for this set of data on the Studio property proportion. In the practical sense, the Studio properties seem to be a lower proportion of the sample than the proposed benchmark of 20%. This means that Studio properties could be less common in the sample of housing pledges for sale in general than other property types, e.g. Independent House and Farmhouse². But this is only a conclusion based on this edited dataset and shouldn't be considered a national housing estimate, since the market lacks more representative data.

3. Is the average number of rooms in an Apartment property type more than 3?

The second analysis is limited to only those observations where property_type is an Apartment. The sample size after the filtering is 418 properties referred to as Apartment. The number of rooms is numerical, therefore it is a one-sample right-tailed t-test to test if the true mean number of rooms is > 3 . Apartment properties have a mean of 4.347 rooms, and a median of 4 rooms as indicated in the descriptive statistics. The standard deviation is 2.256 indicating that the numbers of rooms in apartments are not uniform.

Table 2: Summary statistics for rooms in Apartment properties

² <https://research.monash.edu/en/publications/the-new-normal-changed-patterns-of-dwelling-demand-and-supply/>

Statistic	Value
Sample size	418.000
Mean rooms	4.347
Median rooms	4.000
Standard deviation	2.256
Minimum	1.000
Q1	2.000
Q3	6.000
Maximum	8.000

Figure 2: Boxplot of rooms for Apartment properties

The box plot shows that the room variable Apartment is distributed across the different categories of rooms available, but does not reveal any extreme outlier scores by using the interquartile range rule. The sample size is also large, thus the t-test is fairly robust. The hypotheses are $H_0: \mu \leq 3$ and $H_1: \mu > 3$. The test statistic = $t = (\text{mean of the sample} - 3) / (\text{standard deviation} / \text{square root of } n)^3$.

Table 3: One-sample t-test output for Apartment rooms

Hypothesis test item	Result
H0	$\mu \leq 3$
H1	$\mu > 3$
Significance level	0.05
Test statistic	12.205
Degrees of freedom	417
Critical value	1.649

³ <https://link.springer.com/article/10.1007/s10901-024-10134-5>

Hypothesis test item	Result
p-value	< 0.001
Decision	Reject H0

The p-value is <0.001 with 417 degrees of freedom and test result $t = 12.205$. The p value is less than the level of significance (0.05) so the null hypothesis is rejected. The average number of rooms in Apartment properties has been statistically determined to be more than 3. The apartment segment in this dataset is not very small dominated. This may appeal to property agents and purchasers, as it seems the average Apartment property is more than the minimum three room "standard".

4. Is the average price of a Fully-Furnished House significantly higher than the average price of an Unfurnished House?

The fourth section compares the price of houses on the basis of the furnishing status. Independent House in Dataset 1 is a representation of the house category. Thus, only the data from Independent House have been analysed and the Fully-Furnished and Unfurnished groups compared. Semi-Furnished houses are summarized in the summary table but are not included in the hypothesis test since the question in the assessment is about comparing Fully-Furnished houses to Unfurnished houses⁴.

Table 4: Independent House price summary by furnishing status

Furnishing status	n	Mean price	Median price	Std dev
Fully-Furnished	128	\$979,371	\$929,044	\$485,684
Unfurnished	157	\$1,037,736	\$1,047,751	\$522,936
Semi-Furnished (not tested)	154	\$1,069,639	\$1,124,264	\$500,810

Figure 3: Price distribution for Fully-Furnished and Unfurnished Independent Houses

⁴ <https://www.sciencedirect.com/science/article/pii/S2226585620302168>

The findings for the descriptive results are not supportive of the assumption of a higher average price of Fully-Furnished houses. The mean price for Fully-Furnished Independent Houses is \$979,371 and Unfurnished Independent Houses are \$1,037,736. This results in a mean difference in the sample of -\$58,365. The box plot further indicates that the price distributions overlap, indicating that house price differences may not be exclusively related to the furnishing status⁵.

Table 5: Welch two-sample t-test output for Independent House prices

Test item	Result
H0	μ Fully-Furnished $\leq$ μ Unfurnished
H1	μ Fully-Furnished $>$ μ Unfurnished
Significance level	0.05
Test type	Welch two-sample t-test
Mean difference	\$-58,365
Test statistic	-0.975
Degrees of freedom	278.199
Critical value	1.650
One-tailed p-value	0.835
Decision	Fail to reject H0

The Welch two-sample t-test gives $t = -0.975$, $df = 278.199$ and a one-tailed p-value of 0.835. The p value is considerably larger than 0.05, the null hypothesis can't be rejected. There is no evidence that Fully-Furnished Independent Houses have a significantly higher mean price than Unfurnished Independent Houses. It does not mean that in this data set the status of furnishing should be taken as a stand-alone indicator for a higher selling price for management decision making purposes. Other factors like property size, location, number of rooms and market demand may be the other significant factors influencing property prices⁶.

⁵ <https://www.emerald.com/f/article/41/1-2/1/76968>

⁶ <https://www.tandfonline.com/doi/full/10.1080/14649357.2019.1651997>

5. Can one predict loan amount using customer salary, down payment and property size sqft?

In the fifth section, multiple regression is used to see if loan_amount can be predicted based on customer_salary, down_payment and property_size_sqft. Loan amount is the dependent variable as it is what we are trying to predict. The three independent variables are: buyer income capacity, buyer contribution and physical property size. Correlations were examined to gain insights into the simple pairwise relationships prior to running the regression.

Table 6: Correlation between loan amount and each independent variable

Independent variable	Correlation with loan_amount	Interpretation
customer_salary	0.018	Very weak positive relationship
down_payment	0.443	Moderate positive relationship
property_size_sqft	0.907	Very strong positive relationship

Figure 4: Loan amount and customer salary

Figure 5: Loan amount and down payment

Figure 6: Loan amount and property size sqft

The results in the scatterplots are consistent with the correlation results. It can be seen that customer's salary shows very little correlation with the amount of loans. The other two variables—down payment and property size—have moderate or very strong positive pairwise relationships. This implies that loan repayment amount is most closely related to property value and size, and not just salary⁷.

Table 7: Regression summary output

⁷ <https://www.tandfonline.com/doi/full/10.1080/09599916.2021.1993315>

Regression statistic	Value
Multiple R	1.000
R Square	1.000
Adjusted R Square	1.000
Standard Error	2,862.587
Observations	2,500.000
F statistic	12,848,345.174
Significance F	< 0.001

Table 8: Regression coefficients and significance

Variable	Coefficient	p-value	Decision
Intercept	-83.7921	0.634	Not significant
customer_salary	-0.0001	0.954	Not significant
down_payment	-0.9998	< 0.001	Significant
property_size_sqft	319.9886	< 0.001	Significant

The overall regression model is highly significant as R Square = 1.000 and Significance F < 0.001. This implies that this adjusted data set accounts for nearly all of the variance of loan_amount in the original data set. This is an approximation of the regression equation: $\text{loan_amount} = -83.792 - 0.0001(\text{customer_salary}) - 0.9998(\text{down_payment}) + 319.9886(\text{property_size_sqft})$.

There's a point of management to note from the individual coefficients. Property_size_sqft is statistically significant and positive, indicating that larger properties are related to bigger loan amounts, after controlling for the other variables. Down_payment is negative and statistically significant (as expected, since a higher down payment means that less will be needed to be borrowed in order to buy a property, when its value is fixed). The customer_salary is not statistically significant as its p-value is greater than 0.05, p-value = 0.954. So, the three predictors can be used to predict the loan amount very strongly⁸, but in this model down payment

⁸ <https://ascelibrary.org/doi/abs/10.1061/%28ASCE%29UP.1943-5444.0000766>

and property size are useful predictors, not salary. One problem is that the data may have a close relation in the edited data set that is more like an accounting type relation than a market-level predictive model, and that this may give a very high R square.

6. Is there an association between the two categorical variables?

There are 40 surveys on temporary housing in Dataset 2. The research question is as follows: Is there a relationship between type of preferred temporary accommodation and main booking priority? Accommodation_Preference and Booking_Priority are two categorical variables. The chi-square test of independence is appropriate for these two categorical variables and the purpose of the test is to determine whether there is an association between the two variables⁹.

Table 9: Observed counts for Dataset 2 survey

Accommodation preference	Price	Location	Row total
Airbnb	16	6	22
Hotel	7	11	18

Table 10: Expected counts for chi-square test

Accommodation preference	Price	Location
Airbnb	12.65	9.35
Hotel	10.35	7.65

Figure 7: Accommodation preference by booking priority

The table above illustrates that for Airbnb, price was the top consideration for 16 of 22 respondents and for hotel, it was location for 11 of 18 respondents. This indicates that in this sample, Airbnb preference is more associated with the price, while hotel preference is more associated with location. The main condition of chi square, the expected count is more than 5 for all the values, so it is good.

Table 11: Chi-square test output for Dataset 2

⁹ <http://tandfonline.com/doi/abs/10.1080/02673037.2019.1636938>

Chi-square test item	Result
H0	No association between accommodation preference and booking priority
H1	There is an association between accommodation preference and booking priority ¹⁰
Significance level	0.05
Chi-square statistic	4.639
Degrees of freedom	1
p-value	0.031
Decision	Reject H0

The chi square is 4.639, 1 degree of freedom and a p value of 0.031. The p-value is smaller than the significance level (0.05), so we reject the null hypothesis. The type of accommodation preferred is statistically significantly related to booking priority. For the accommodation managers, this means that Airbnb-style accommodation could appeal to different kinds of customers to hotel customers in this survey, as this segment is more price sensitive. The sample size of the survey, however, is small and the result should therefore be considered as an indicator and not as a market conclusion¹¹.

7. Conclusion and reflection

There were six statistical questions answered using Dataset 1 and Dataset 2. The results from section 2 indicated that the proportion of the property in the Studio property was 15.9% (95% CI: 14.5% to 17.4%). However, the proportion of Studio property was not considered to be a plausible value for this sample since 20% was outside this interval. Strong evidence in Section 3 indicated that, on average, Apartment properties have more than three rooms. The mean of the sample was 4.347 rooms and the one-sample t-test result gave a p-value less than 0.001. The average prices of Fully-Furnished Independent Houses and Unfurnished Independent Houses were not different, at least in terms of evidence found in Section 4. Indeed, the sample mean price of Fully-Furnished Independent Houses was lower and the p-value of the Welch t-test was 0.835. Section 5 demonstrated that the combination of the three predictors predicted the amount of the loan very well, but only down payment and property size were statistically significant

¹⁰ <https://link.springer.com/article/10.1007/s11831-023-10010-5>

¹¹ <https://www.sciencedirect.com/science/article/pii/S0957417425013703>

predictors; customer salary was not. The strong relationship between accommodation preference and booking priority was found in dataset 2, which was seen in section 6.

The results indicate what action should be taken by the stakeholders. It is important for a property investor to not assume the sample of properties in the market are 20% Studio property and should seek to understand the demand and supply of each property type before investing. The status of a property should not be used as a proxy for a higher Independent House price as this was not supported by the sample. The amount of a loan is more closely associated with down payment and loan size for this dataset than to salary, but would also depend on credit history, interest rate and serviceability for a bank or lender. Airbnb and hotel customers also could be interested in different booking priorities which should be carefully targeted in a pricing and location marketing strategy.

The potential future research question would be: What are the effects of location, interest rate, age of the property and buyer credit profile of the relationship between the property price, down payment and loan amount in the Australian housing market? This question would extend the current analysis as it is not included in Dataset 1, which doesn't contain location or finance conditions. Another potential direction for future research would be to have a larger accommodation survey with more categories to see if the Dataset 2 association is consistent across traveller age groups, traveller purpose of travel and traveller length of stay.

This assessment helped me to understand the important concepts of statistics as it demonstrates different techniques in answering different kinds of questions. I learned that if a proposed proportion is plausible then it is useful to use a confidence interval to determine this; otherwise, if a sample mean or two group means is to be compared, use a t-test. I also found out that regression can be used for predicting, but also that the meaning of each coefficient and the logical nature of the relationship between the variables must be taken into account in the interpretation of the regression. The key difficulties were the selection of the appropriate test, the selection of the right sub-group for the study and the interpretation of the p values in terms of business. Skills learned can be transferred to the real world when managers are required to make decisions based upon facts instead of feelings. For instance, property companies can see statistical summaries of the housing segments, lenders can take benefit from regression models to grasp the drivers of loans and accommodation businesses can make use of survey analysis to compare the services offered with customer priorities.

Soni_125

1. Introduction

Background of ALFRED Healthcare

ALFRED Healthcare is a massive health care organization that has several hospitals and clinics in the country. Thousands of doctors, nurses and administrators work side by side every day to ensure quality patient care. Effective knowledge management is crucial in today's health care environment. There's a massive amount of information that's generated all the time, from patient medical histories to treatment guidelines. But it is hard to handle this knowledge. When knowledge is not disseminated effectively, it is wasted and patient care suffers¹².

Purpose of the Report

This report aims to come up with a comprehensive and viable Knowledge Management plan for ALFRED Healthcare. This strategy is based on incorporating ethical issues into all aspects of knowledge management. The three main ethical pillars are patient confidentiality, data security and equitable access to knowledge. Through this approach, ALFRED will be able to provide the necessary knowledge to its staff and uphold the rights of its patients. This report demonstrates the benefits that ethical knowledge management can have for efficiency and for improving patient care¹³.

2. Case Analysis

Current Challenges Faced by ALFRED Healthcare

There are multiple challenges to be addressed for ALFRED Healthcare. First, the swift progress of digital health records has generated an enormous amount of data, which is challenging to organize and effectively search. Second, the ALFRED network is a collection of hospitals that may not work together. If a breakthrough at one hospital, it may not be able to reach other locations quickly, so that the patient may receive different levels of care¹⁴. Thirdly, there is always

¹² https://www.researchgate.net/publication/305258591_Designing_Knowledge_Management_Strategy

¹³ <https://c8health.com/blog/effective-knowledge-management-strategies-for-your-business>

¹⁴ <https://pmc.ncbi.nlm.nih.gov/articles/PMC12460784/>

the risk of cyber-attacks and data breach. Healthcare information is valuable to criminals, and ALFRED needs to guard against this. Last but not least, many staff are uncertain what information they can pass on, to whom and when.

Ethical issues that need to be addressed

The issues of ethics that ALFRED are grappling with are not trivial and intertwined. The most basic concern is patient confidentiality. ALFRED is entrusted with the most intimate details of patients' minds, such as disease and psychiatric background¹⁵. These confidences are a breach of trust and can have a detrimental impact on patients if breached. Secondly, data security is a major concern¹⁶. Even with the best of intentions to keep patients' data confidential, the security is weak and hackers can take what they want. Equitable access is the third concern. In many organizations, part of the staff has more access to knowledge than others.

3. Designing the Knowledge Management Strategy

Overview of the Proposed KM Strategy

The proposed KM strategy incorporates the ethical dimension in all aspects of knowledge management. Ethics is not added-on but a fundamental aspect of the capturing, storing, sharing, and using of knowledge¹⁷. The strategy has three specific aims. First, make sure that any patient information is never accessed by anyone else. Second, ensure that all health care professionals possess the information they must have to perform their duties efficiently¹⁸. Third, encourage staff to share information ethically and knowingly with the understanding that it enhances patient care and that it respects patient's dignity.

Key Principles Guiding the Strategy

The entire strategy is based on three principles. The first principle is to keep patient confidentiality is paramount. No business goal or convenience is more important than protecting patient privacy. If easy access is in conflict with secure access, secure access prevails. Security by design is the

¹⁵

https://www.researchgate.net/publication/342501998_Critical_Review_of_Knowledge_Management_in_Healthcare

¹⁶ <https://pmc.ncbi.nlm.nih.gov/articles/PMC10568450/>

¹⁷

https://www.researchgate.net/publication/374233716_Current_challenges_and_potential_solutions_to_the_use_of_digital_health_technologies_in_evidence_generation_a_narrative_review

¹⁸

https://www.researchgate.net/publication/393228300_The_Role_of_Knowledge_Management_Processes_in_Enhancing_Strategic_Performance

second principle. All tools and processes should be secured from the outset. Security is not a "bolt-on" feature. The third is access which must be fair and equitable¹⁹.

Recommended Tools and Technologies

ALFRED will make use of a number of specific technologies. The first is an integrated knowledge base that everyone can access in a safe environment. A very secure digital library, storing all approved medical guidelines, patient care protocols and best practices. The data in the repository is encrypted, that is, if data is stolen, it will be impossible to read it without the encryption key²⁰. The second technology is role based access control. This system automatically assigns the access that a user has to based on the job role. The receptionist can view patient names and appointment times but not medical history.

Key Processes and Practices

Technology is not the only solution. ALFRED needs to ensure that it has clear systems in place which incorporate ethics into everyday working. Data privacy protocols is the first key process. All patient data must be anonymized (masked) before it can be used for anything other than direct patient care, for example, for training or research. Patients must also be informed of any non-treatment uses of their data and give informed consent. Written knowledge sharing policies is the second key process. The Ethical Sharing Code, in simple terms, will outline three basic rules: never share patient data through personal email or text message; always use the secure KM system to share patient data; and, if in doubt, consult an ethics supervisor before sharing patient data. The third key process is compulsory ethical training²¹.

.4. Ethical, Legal, and Managerial Considerations

Ethical Issues

Protecting Patient Confidentiality. In the event of an emergency, ALFRED will have a break-the-glass process. In an emergency, a doctor only clicks a button and enters a concise note for accessing a patient's record. .

Ensuring Equitable Access. Equitable access is when all employees can have access to all the information they need to perform their tasks. ALFRED will develop a Knowledge Access Matrix that includes all jobs and the precise knowledge a job requires²².

¹⁹ <https://www.emerald.com/jkm/article/30/11/189/1346481/The-hidden-layers-of-knowledge-management>

²⁰ <https://www.sciencedirect.com/science/article/pii/S2405844025024983>

²¹ <https://www.mdpi.com/2071-1050/13/13/7118>

²² <https://www.investopedia.com/terms/b/business-ethics.asp>

Legal Issues

Adhering to Data Protection Laws. ALFRED will set the Legal Requirements for the automatically-configured KM system. After 7 years, a law is automatically deleted from the system. A patient can request a copy of his/her records and the system can be made to provide it at the instant. This minimizes human error, resulting law violations²³.

Establishing Legal Accountability. Each access event is documented in the audit logs. Two people, the Chief Medical Officer and Data Protection Officer, have legal responsibilities for KM ethics. If someone intentionally accesses records for any other purpose, e.g. to satisfy curiosity, this is viewed as a violation and is met with termination and prosecution.

Managerial Issues

The Part of Leadership. Leaders should show, reinforce and champion ethical KM. They'll sign a public Ethical KM Charter, engage with the system as prescribed and never circumvent the security. Quarterly town halls on ethical KM will be led by the CEO. If leaders show interest in ethics, then they will have interest in ethics²⁴.

Managing Change. Resistance is normal. ALFRED will explain the reasons for change, implement a pilot project first, create a helpline for employees to reach out to at any time, and select KM champions from each department to assist others.

Continuous Improvement. A permanent KM Ethics Committee is formed, which meets monthly to review audit reports, discuss emerging threats and make recommendations for improvements. The whole strategy is reviewed every 6 months and updated as necessary. 5. Addressing the Eight Key Questions

Question One: Integrating Ethical Considerations into KM Practices

ALFRED can embed privacy controls at each stage of a knowledge's lifecycle to integrate ethics. The system sets the flag "sensitive" if knowledge is collected. When stored, it is encrypted. If shared, the system must verify a valid reason and validates the recipient's authorization. The system reminds staff members before they open a patient record: "Remember: Only access what is necessary for patient care²⁵."

²³ <https://www.universalclass.com/articles/business/your-legal-and-ethical-responsibilities-as-a-manager.htm>

²⁴ <https://www.avadolearning.com/blog/legal-ethical-considerations-hr/>

²⁵ <https://askfilo.com/user-question-answers-smart-solutions/explain-the-ethical-legal-and-managerial-issues-that-3336333339303133>

Question Two: Ensuring Compliance with Data Protection Laws While Facilitating Efficient Sharing

There will be rules embedded in the KM system that will comply with the legal requirements. For instance, if a law states that only certain doctors may view the HIV status, then that is what happens in the system—no one else can see that field. ALFRED will develop knowledge bundles of anonymized data which will be available for free access to new users for education and research purposes.

Question Three: Cultivating a Culture of Ethical Knowledge Sharing

ALFRED will launch a monthly 'Ethical Sharer of the Month' award. Staff members are free to nominate another staff member who used good judgment in sharing information with good regard to privacy. The winner gets to be recognized and a small amount of money as a reward. Also, there will be monthly Ethics huddles held in each department for staff to anonymously share challenging situations and discuss what to do.

Question Four: The Role of Leadership in Promoting Ethical KM

Leaders demonstrate good conduct and use the system as they should. They are consistent, so that a mistake by a junior nurse is addressed in the same way as one made by a senior surgeon, who is in charge of working with the junior. They are consistent – a mistake from a Junior nurse is addressed in the same way that an error is addressed by a Senior surgeon who is supervised by the Junior. They support through the provision of resources, budgets and time for training. The CEO emails one example of great ethical KM every month to keep the topic of ethics front and centre.

Question Five: Ensuring Equitable Access While Preventing Unauthorized Access

The answer is a tiered but just access system. In ALFRED, every job role is mapped to the knowledge required for it. A rural clinic nurse can access treatment protocols as well as a city hospital nurse, but neither can have access to other patients' information. A just in time access system enables staff to request access and supervisor to approve access in minutes using a mobile phone for temporary access needs.

Question Six: Technological Tools to Enhance Security and Monitor Compliance

All ALFRED data stored and transmitted will be encrypted end to end. The blockchain-based audit trail records all accesses in a permanent and tamper-proof log. Behavioral analytics using AI algorithms detect normal patterns and alert to abnormal behaviors, like a nurse accessing 200

medical records at 2am. Automated redaction obscures sensitive data from unauthorized parties²⁶.

Question Seven: How to overcome resistance to new KM practices

Communication, involvement, support and escalation are used to deal with resistance. ALFRED provides an explanation of why changes are needed. Staff are involved in designing workflows. You have a helpdesk and departmental KM champions who are available 24/7. Formal disciplinary action is taken only after the above steps have been taken by a staff member who has intentionally circumvented security measures²⁷.

Question Eight: Strategies for Continuous Evaluation and Improvement

The EDGE framework is used in ALFRED: Evaluate, Decide, Grow, Evolve. There are quarterly surveys undertaken for staff and patients to gather feedback. Data is reviewed by the KM Ethics Committee and changes are decided upon. Changes are implemented on a small scale in one department before implementation in other departments²⁸.

6. Demonstration of the KM Solution

A Realistic Scenario

One patient comes into a small rural ALFRED clinic with chest pain. A nurse must ask whether the patient has any drug allergies before giving a drug. Two years ago the patient was treated at a hospital in the city, but that hospital is far away. Sarah doesn't have time for faxes or telephone calls.

How the KM System Responds

Sarah logs into the KM system with her fingerprint and 1- time code sent to her phone. She searches for the patient's name. The system confirms she has a role of Rural Nurse, and that she is permitted to access allergy information in emergency²⁹. The system now shows the patient's allergy status with a severe allergy to penicillin³⁰. Other sensitive information, which is not required to make a decision for the emergency, is automatically masked. All accesses are recorded in

²⁶

²⁷ <https://pmc.ncbi.nlm.nih.gov/articles/PMC11723644/>

²⁸ <https://pmc.ncbi.nlm.nih.gov/articles/PMC11723644/>

²⁹ <https://www.ncbi.nlm.nih.gov/books/NBK594999/>

³⁰ <https://pmc.ncbi.nlm.nih.gov/articles/PMC3093070/>

blockchain audit trail. The system also automatically fetches the latest treatment protocol for the patients of chest pain with penicillin allergy and shows it along with the patient's record³¹.

The Ethical Check

Once the patient is stabilized, Sarah is notified that her access was rightly granted for the care of the patient. She clicks Yes. By accessing the record in an improper manner, she would have triggered an alert for human review³².

Impact Assessment

Efficiently, it used to take hours and now less than 30 seconds. Encryption, access controls and monitoring significantly lower the risk of breaches in relation to security. So, in the health care area, it's just like having the correct information at the proper time saves lives. Sarah had instant access to patient's allergy record so the patient is given the correct medicine and has no allergic reaction³³.

7. Conclusion

Summary of the KM Strategy

The report focused on ALFRED Healthcare, and proposed a comprehensive Knowledge Management strategy with a focus on ethical aspects. The strategy covers patient confidentiality, data security, and equity of access. It suggests to implement encrypted repositories, role-based access control, blockchain audit trails, and AI monitoring. It sets up data anonymization, the Ethical Sharing Code, and the training requirement.

Final Recommendations

To create the KM Ethics Committee and start a pilot project in 1 hospital within 30 days. Secondly, implement full role-based access control within 6 months and provide first phase of mandatory training for all staff. Third, in one year, roll out AI-driven monitoring and first independent third-party audit. 4) Continue the EDGE cycle of continuous improvement on a quarterly basis. Adhering to these guidelines will safeguard patient privacy, ensure legal compliance, and foster a strong ethical culture at ALFRED Healthcare.

Recipe of Chicken

Chicken is one of the most popular foods enjoyed all around the world. It is tasty, nutritious, affordable, and can be cooked in many different ways. Different countries and cultures have their own special chicken dishes. In Nepal and many South Asian countries, chicken curry is a favorite meal that is often eaten with rice, roti, or naan. Chicken is rich in protein and provides energy to the body. It is loved by children and adults alike because of its delicious flavor and soft texture. Preparing chicken is also considered an important cooking skill because it requires proper cleaning, seasoning, and cooking methods. A good chicken recipe not only satisfies hunger but also brings family members together during meals and celebrations.

One of the most famous and delicious chicken dishes is chicken curry. Chicken curry is made using chicken pieces, onions, tomatoes, spices, oil, garlic, ginger, and other ingredients. The recipe may vary from place to place, but the basic method remains similar. It is a flavorful and aromatic dish that can be prepared at home easily. Cooking chicken curry requires patience and attention because the spices must blend properly with the chicken to create a rich taste. A well-cooked chicken curry has tender chicken pieces and thick gravy filled with flavor.

To prepare chicken curry, several ingredients are needed. The main ingredient is fresh chicken, usually cut into medium-sized pieces. About one kilogram of chicken is enough for a family meal. Other ingredients include two chopped onions, two tomatoes, ginger paste, garlic paste, green chilies, turmeric powder, chili powder, coriander powder, cumin powder, salt, garam masala, cooking oil, and fresh coriander leaves for decoration. Some people also add yogurt, butter, or cream to make the curry richer and smoother. Potatoes can also be added for extra taste and texture.

The first step in preparing chicken curry is cleaning the chicken properly. The chicken pieces should be washed carefully with clean water to remove dirt and unwanted smell. After washing, the water should be drained completely. Then the chicken can be marinated with salt, turmeric, ginger-garlic paste, and a little yogurt. Marination helps the chicken absorb flavor and become tender. It is best to leave the chicken for about thirty minutes before cooking.

Next, a cooking pan or pot is heated with oil. Once the oil becomes hot, chopped onions are added and fried until golden brown. This step is very important because browned onions give sweetness and rich flavor to the curry. After the onions are cooked, ginger paste, garlic paste, and green chilies are added. The mixture is stirred for a few minutes until a pleasant aroma comes out. Then chopped tomatoes are added and cooked until they become soft and blend with the spices.

After the tomatoes soften, different spices such as turmeric powder, chili powder, coriander powder, cumin powder, and salt are mixed into the masala. The spices should be cooked carefully on low heat so they do not burn. A little water may be added if the mixture becomes too dry.

Cooking the spices properly is important because it enhances the taste and color of the curry. The masala becomes thick and oily when it is fully cooked.

The marinated chicken pieces are then added into the pan. The chicken should be mixed well with the masala so that every piece is coated with spices. The chicken is cooked on medium heat for several minutes while stirring occasionally. Gradually, the chicken changes color and releases its own juice. This process allows the meat to absorb all the flavors of the spices. Some people fry the chicken for a longer time to achieve a deeper flavor.

After frying the chicken, water is added according to the desired consistency of the curry. If thick gravy is preferred, less water is added, while more water creates a thinner curry. The pot is then covered with a lid, and the chicken is allowed to cook slowly for about twenty to thirty minutes. During this time, the chicken becomes soft and tender. The curry also develops a rich aroma that makes everyone eager to eat.

When the chicken is fully cooked, garam masala is sprinkled on top for extra flavor. Fresh coriander leaves are also added as decoration. Some people squeeze a little lemon juice to give freshness to the dish. The chicken curry is now ready to be served. It is usually enjoyed hot with steamed rice, roti, naan, or chapati. The combination of spicy curry and warm rice creates a delicious and satisfying meal.

Chicken curry is not only delicious but also nutritious. Chicken contains protein, vitamins, and minerals that help build muscles and maintain good health. Garlic and ginger are also beneficial because they improve digestion and strengthen the immune system. However, too much oily or spicy food should not be eaten regularly because it may affect health negatively. Therefore, balanced cooking with moderate oil and spices is important.

Cooking chicken curry also teaches valuable life skills. It helps people learn patience, cleanliness, and responsibility in the kitchen. Preparing food for family members creates feelings of love and care. In many homes, cooking together becomes a joyful activity where family members share stories and laughter while preparing meals. Food has the power to connect people emotionally and culturally.

In conclusion, chicken curry is one of the most loved and flavorful dishes around the world. It is prepared using chicken, spices, onions, tomatoes, and other ingredients that blend together to create a rich and tasty curry. The cooking process involves cleaning, marinating, frying spices, and simmering the chicken until tender. Chicken curry is enjoyed with rice or bread and is suitable for daily meals as well as special occasions. Besides being delicious, it is also nutritious and comforting. Learning how to cook chicken curry is a useful skill that can bring happiness to both the cook and the people enjoying the meal.
